

### **Prompt\_1**

*I'm a job seeker looking for B2B account manager positions in the fintech payments vertical. Here are some of my target companies:*

- Stripe
- Ayden
- Tipalti

*Your task is to generate 20 companies within the same vertical.*

### **Prompt\_2**

Find companies in [industry] that are most likely to expand hiring for [target role] in [city/region/country]. Search across the following signals:

- raised a funding round (Seed–Series C),
- hired a new leader in or adjacent to [function],
- launched a product or major partnership,
- posted 3+ new jobs in [function],
- hired multiple people in the last 90 days,
- announced new enterprise customers or contracts.

For each company, compile *all signals you can find from the past 90 days* and note if multiple signals overlap (e.g., raised funding + new job postings + product launch).

Prioritize companies with **2+ signals** over those with just one.

Return results in a structured table with columns:

- Company
- Location (HQ or hiring region)
- Signals Found (list each signal with date, combine into one company row if there are multiple signals)
- Signal Strength (Low = 1 signal, Medium = 2 signals, High = 3+ signals)
- Source Links (one most relevant link per signal).
- Why this suggests upcoming hiring in [function]

Check that all your links are valid, working properly, and relevant.
